- NFA construction
- applications

# 5.4 REGULAR EXPRESSIONS

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
  - applications

ROBERT SEDGEWICK | KEVIN WAYNE

http://algs4.cs.princeton.edu

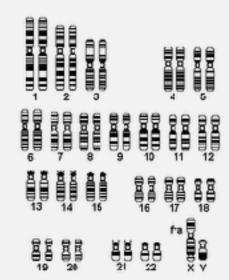

#### Pattern matching

Substring search. Find a single string in text.

Pattern matching. Find one of a specified set of strings in text.

#### Ex. [genomics]

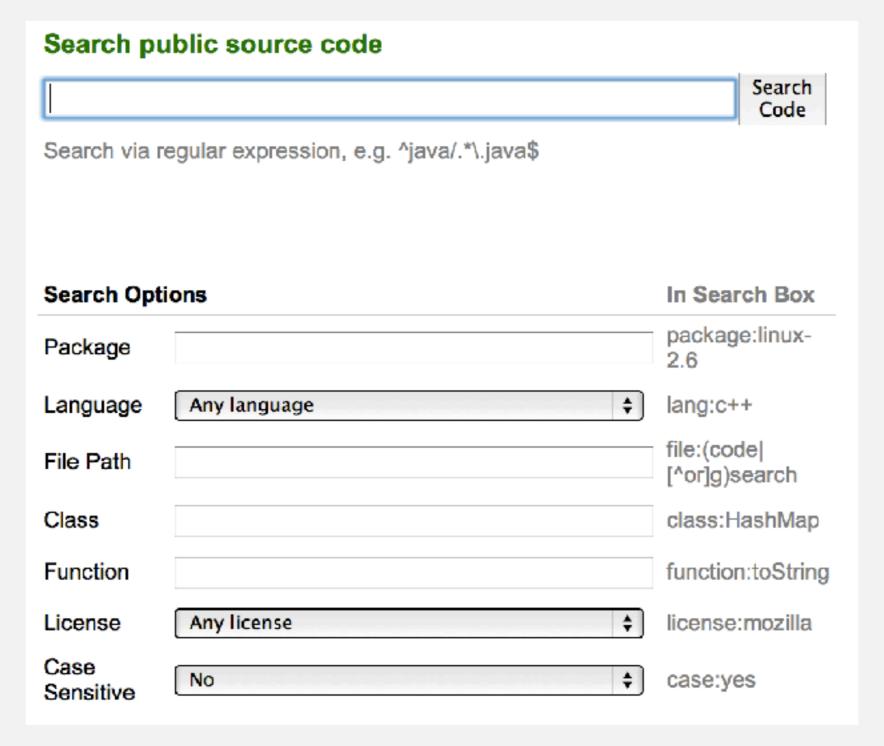

- Fragile X syndrome is a common cause of mental retardation.
- A human's genome is a string.
- It contains triplet repeats of CGG or AGG, bracketed by GCG at the beginning and CTG at the end.
- Number of repeats is variable and is correlated to syndrome.

pattern GCG(CGG|AGG)\*CTG

text GCGGCGTGTGCGAGAGAGTGGGTTTAAAGCTGGCGCGGAGGCGGCTGGCGCGGAGGCTG

#### Google code search

http://code.google.com/p/chromium/source/search

#### Pattern matching: applications

#### Test if a string matches some pattern.

- Scan for virus signatures.
- Process natural language.
- Specify a programming language.
- Access information in digital libraries.
- Search genome using PROSITE patterns.
- Filter text (spam, NetNanny, Carnivore, malware).
- Validate data-entry fields (dates, email, URL, credit card).

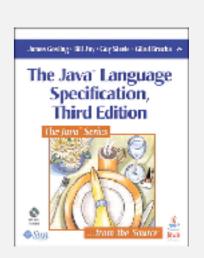

. . .

# Form Validation First name Last name Username: Frank Preserved: Phone: Date Address Some integ

#### Parse text files.

- Compile a Java program.
- · Crawl and index the Web.
- Read in data stored in ad hoc input file format.
- Create Java documentation from Javadoc comments.

. . .

#### Regular expressions

A regular expression is a notation to specify a set of strings.

operation	order	example RE	matches	does not match
concatenation	3	AABAAB	AABAAB	every other string
or	4	AA   BAAB	AA BAAB	every other string
closure	2	AB*A	AA ABBBBBBBBA	AB ABABA
parentheses	1	A(A B)AAB	AAAAB ABAAB	every other string
		(AB)*A	A ABABABABA	AA ABBA

#### Regular expression shortcuts

Additional operations are often added for convenience.

operation	example RE	matches	does not match
wildcard	.U.U.U.	CUMULUS JUGULUM	SUCCUBUS TUMULTUOUS
character class	[A-Za-z][a-z]*	word Capitalized	camelCase 4illegal
at least 1	A(BC)+DE	ABCDE ABCBCDE	ADE BCDE
exactly k	[0-9]{5}-[0-9]{4}	08540-1321 19072-5541	11111111 166-54-111

Ex. [A-E]+ is shorthand for (A|B|C|D|E)(A|B|C|D|E)\*

#### Regular expression examples

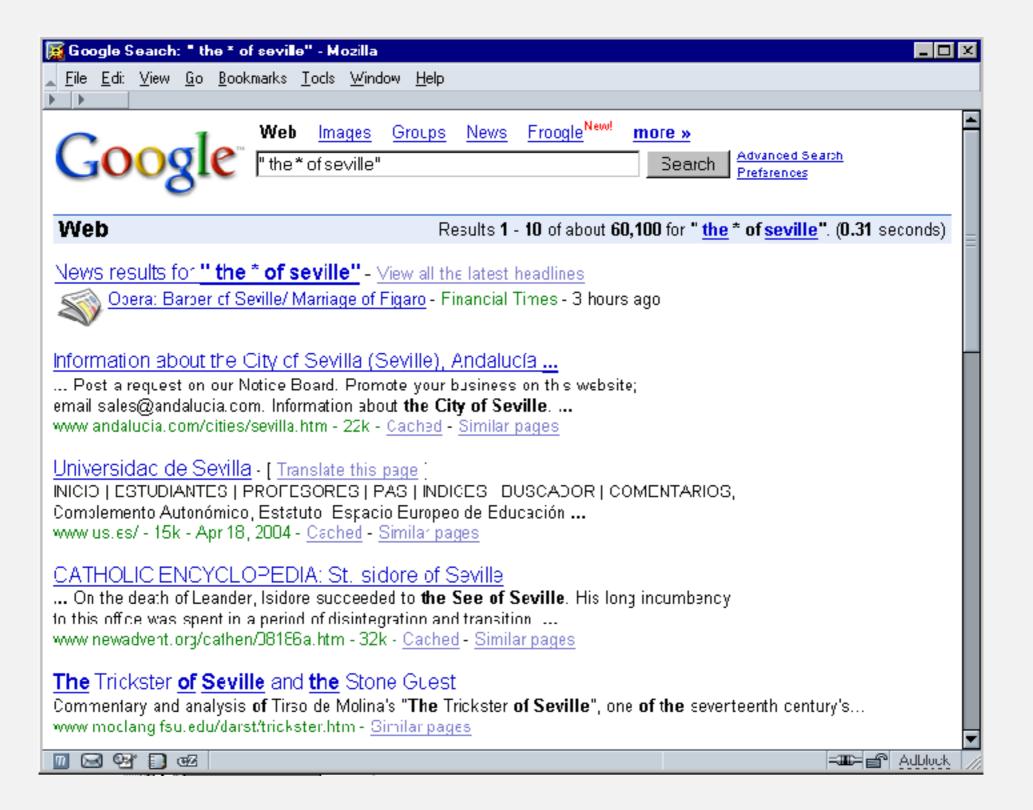

RE notation is surprisingly expressive.

regular expression	matches	does not match
.*SPB.* (substring search)	RASPBERRY CRISPBREAD	SUBSPACE SUBSPECIES
[0-9]{3}-[0-9]{2}-[0-9]{4} (U. S. Social Security numbers)	166-11-4433 166-45-1111	11-5555555 8675309
[a-z]+@([a-z]+\.)+(edu com) (simplified email addresses)	wayne@princeton.edu rs@princeton.edu	spam@nowhere
[\$_A-Za-z][\$_A-Za-z0-9]* (Java identifiers)	ident3 PatternMatcher	3a ident#3

REs play a well-understood role in the theory of computation.

#### Can the average web surfer learn to use REs?

Google. Supports \* for full word wildcard and | for union.

#### Can the average programmer learn to use REs?

#### Perl RE for valid RFC822 email addresses

 $\label{eq:linear_continuous} $$ r^n?[ \t])^n(?:\.(?:(?:\r\n)?[ \t])^n(?:[^(?:[^\\",r\]))^n(?:[^\\",r\])^n(?:[^\\",r\n)?[ \t])^n(?:[^\\",r\])^n(?:[^\\",r\n)?[ \t])^n(?:[^\\",r\n)?[ \t])^n(?:[^\",r\n)?[ \$  $\t]))*"(?:(?:\r\n)?[\t])*))*@(?:(?:\r\n)?[\t])*(?:[^()<>@,;:\\".\[\]))|\t[([^\[\])\r\])|\t])*(?:(?:\r\n)?[\t])+|\t[([^([\t])\r)])|\t[([^\[\])\r\])|\t])|\t[([^\[\t])\r\])|\t[([^\[\t])\r\])|\t[([^\[\t])\r\])|\t[([^\[\t])\r\])|\t[([^\[\t])\r\])|\t[([^\[\t])\r\])|\t[([^\[\t])\r\])|\t[([^\[\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([^\t])\r\])|\t[([\t])\r\])|\t[([\t])\r\])|\t[([\t])\r\])|\t[([\t])\r\])|\t[([\t]$  $(?:\r\n)?[\t])*))*|(?:[^() \Leftrightarrow @,;:\''.\[\] \begin{picture}{l} \cline{-0.031} + (?:(?:\r\n)?[\t]) + |\Z|(?=[\["() \Leftrightarrow @,;:\''.\[\]]))|"(?:[^\"\r\n)?[\t]))*"(?:(?:\r\n)?[\t]))*"(?:(?:\r\n)?[\t])) + |\Z|(?=[\["() \Leftrightarrow @,;:\''.\[\]]))|"(?:[^\"\r\n)?[\t]))|"(?:[^\"\r\n)?[\t])) + |\Z|(?=[\["() \Leftrightarrow @,;:\''.\[\]]))|"(?:[^\"\r\n)?[\t]))|"(?:[^\"\r\n)?[\t]))$  $?[ \t])*)* < (?:(?:\r\n)?[ \t])*(?:@(?:[^()<>@,;:\\".\[\] \t])+|\Z|(?=[\["()<>@,;:\\".\[\]]))|\[([^\[\]\r\\]|\\.)*\](?:(?:\r\n)?[ \t])+|\Z|(?=[\["()<>@,;:\\".\[\]]))|\[([^\[\]\r\\]|\\.)*\](?:(?:\r\n)?[ \t])+|\Z|(?=[\["()<>@,;:\\".\[\]]))|\[([^\[\]\r\\])+\\]|\\.)*\]$  $$$ \t]) *) (?: \. ### 5.4 REGULAR EXPRESSIONS

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
  - applications

ROBERT SEDGEWICK | KEVIN WAYNE

http://algs4.cs.princeton.edu

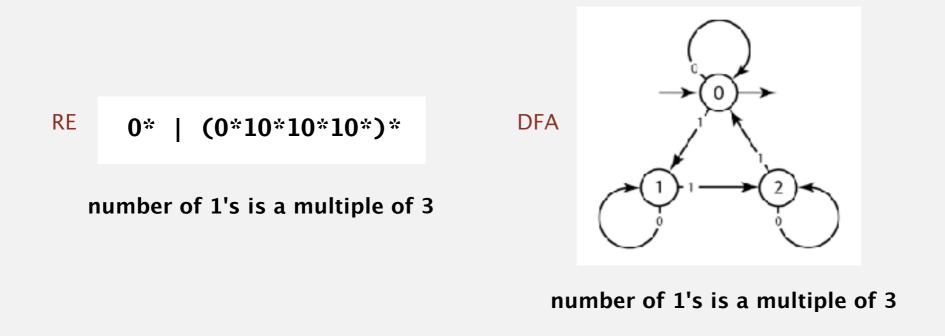

#### Duality between REs and DFAs

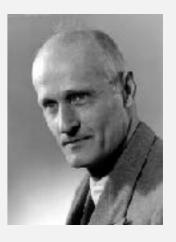

RE. Concise way to describe a set of strings.

DFA. Machine to recognize whether a given string is in a given set.

#### Kleene's theorem.

- For any DFA, there exists a RE that describes the same set of strings.
- For any RE, there exists a DFA that recognizes the same set of strings.

Stephen Kleene Princeton Ph.D. 1934

#### Pattern matching implementation: basic plan (first attempt)

#### Overview is the same as for KMP.

- No backup in text input stream.
- Linear-time guarantee.

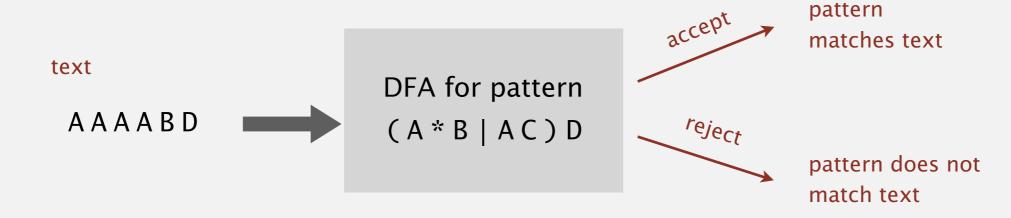

Ken Thompson Turing Award '83

Underlying abstraction. Deterministic finite state automata (DFA).

#### Basic plan. [apply Kleene's theorem]

- Build DFA from RE.
- Simulate DFA with text as input.

Bad news. Basic plan is infeasible (DFA may have exponential # of states).

#### Pattern matching implementation: basic plan (revised)

#### Overview is similar to KMP.

- No backup in text input stream.
- Quadratic-time guarantee (linear-time typical).

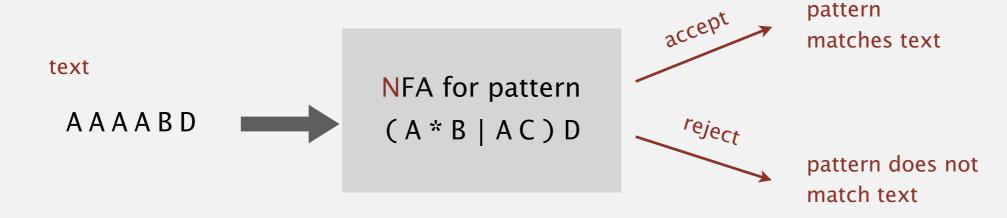

Ken Thompson Turing Award '83

Underlying abstraction. Nondeterministic finite state automata (NFA).

#### Basic plan. [apply Kleene's theorem]

- Build NFA from RE.
- Simulate NFA with text as input.

#### Q. What is an NFA?

#### Nondeterministic finite-state automata

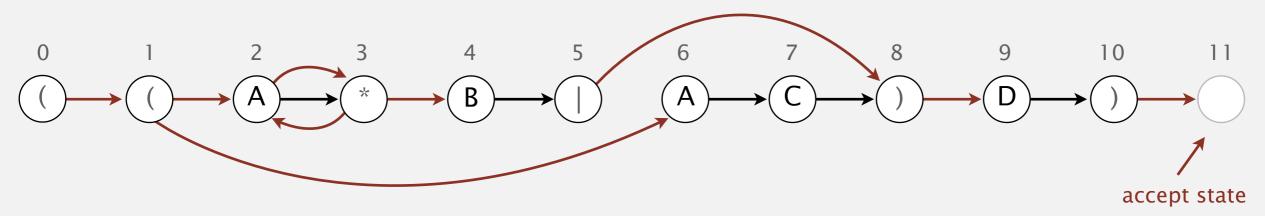

#### Regular-expression-matching NFA.

- We assume RE enclosed in parentheses.
- One state per RE character (start = 0, accept = M).
- Red ε-transition (change state, but don't scan text).
- Black match transition (change state and scan to next text char).
- Accept if any sequence of transitions ends in accept state.

after scanning all text characters

#### Nondeterminism.

- One view: machine can guess the proper sequence of state transitions.
- Another view: sequence is a proof that the machine accepts the text.

## 5.4 REGULAR EXPRESSIONS

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
  - applications

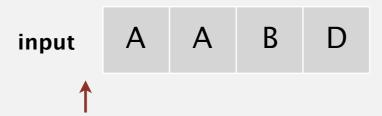

ROBERT SEDGEWICK | KEVIN WAYNE

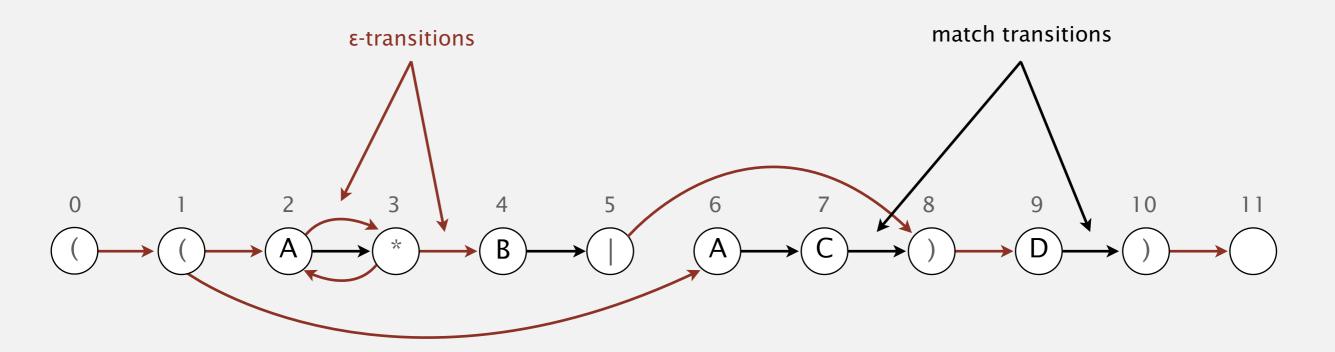

http://algs4.cs.princeton.edu

#### NFA simulation demo

Goal. Check whether input matches pattern.

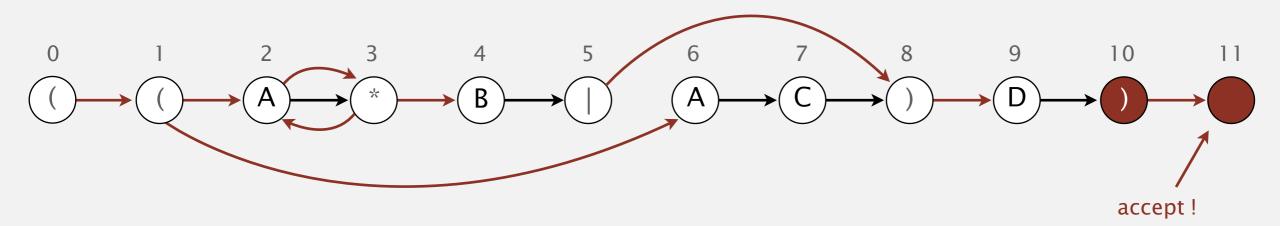

#### NFA simulation demo

#### When no more input characters:

- Accept if any state reachable is an accept state.
- Reject otherwise.

set of states reachable: { 10, 11 }

# Algorithms

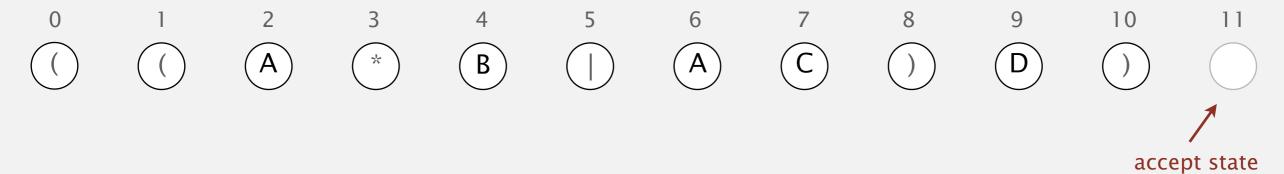

ROBERT SEDGEWICK | KEVIN WAYNE

http://algs4.cs.princeton.edu

#### 5.4 REGULAR EXPRESSIONS

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
  - applications

States. Include a state for each symbol in the RE, plus an accept state.

Concatenation. Add match-transition edge from state corresponding to characters in the alphabet to next state.

Alphabet. A B C D
Metacharacters. ( ) . \* |

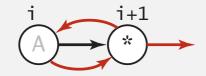

Parentheses. Add  $\varepsilon$ -transition edge from parentheses to next state.

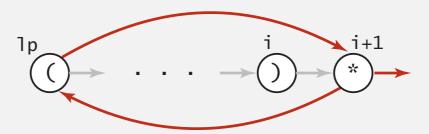

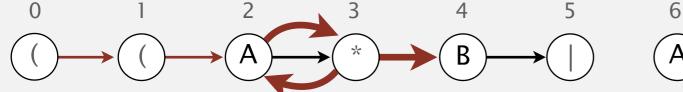

Closure. Add three  $\varepsilon$ -transition edges for each \* operator.

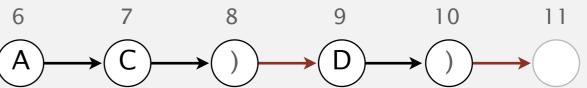

#### single-character closure

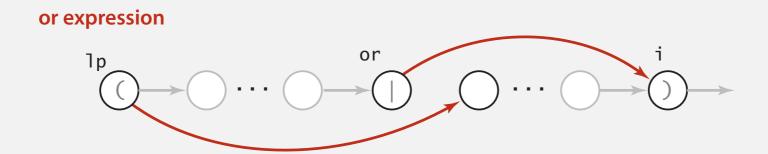

#### closure expression

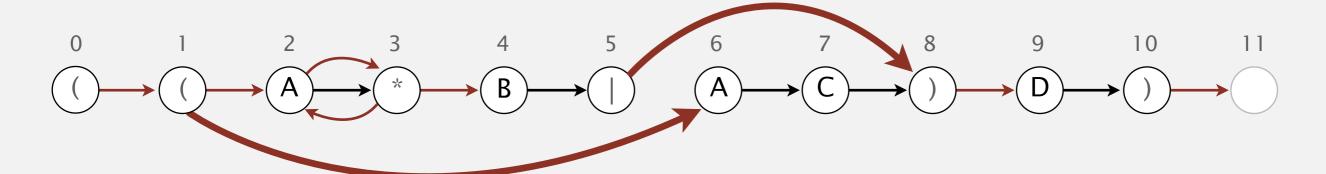

2-way or. Add two  $\varepsilon$ -transition edges for each | operator.

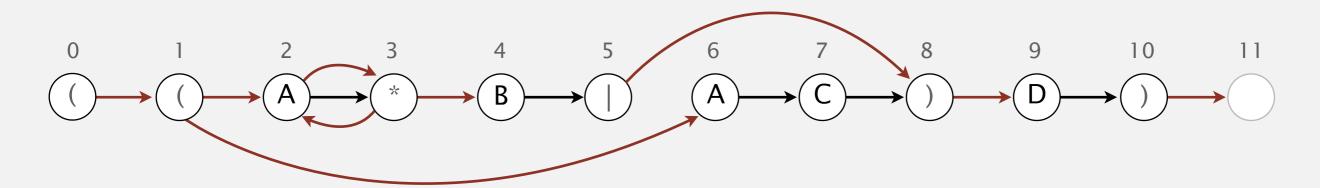

#### NFA construction: implementation

Goal. Write a program to build the  $\varepsilon$ -transition digraph.

Challenges. Remember left parentheses to implement closure and or; remember | to implement or.

Solution. Maintain a stack.

- (symbol: push (onto stack.
- | symbol: push | onto stack.
- ) symbol: pop corresponding ( and any intervening |; add  $\epsilon$ -transition edges for closure/or.

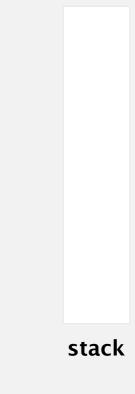

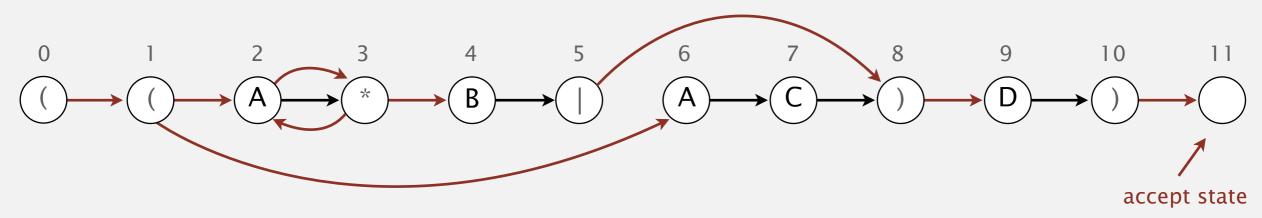

#### NFA construction demo

stack

#### NFA construction demo

NFA corresponding to the pattern ( (  $A * B \mid A C ) D$  )

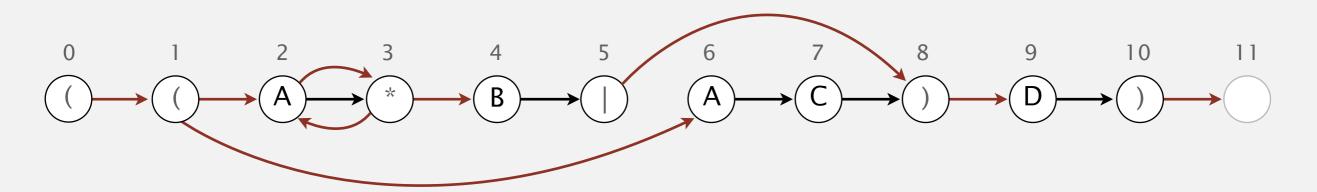

#### NFA construction: Java implementation

```
private Digraph buildEpsilonTransitionDigraph() {
   Digraph G = \text{new Digraph}(M+1);
   Stack<Integer> ops = new Stack<Integer>();
   for (int i = 0; i < M; i++) {
      int lp = i;
      if (re[i] == '(' || re[i] == '|') ops.push(i);
                                                               — left parentheses and |
      else if (re[i] == ')') {
         int or = ops.pop();
         if (re[or] == '|') {
                                                                  2-way or
            lp = ops.pop();
            G.addEdge(lp, or+1);
            G.addEdge(or, i);
         else lp = or;
      if (i < M-1 && re[i+1] == '*') {
                                                                   closure
         G.addEdge(lp, i+1);
                                                                   (needs 1-character lookahead)
         G.addEdge(i+1, lp);
      if (re[i] == '(' || re[i] == '*' || re[i] == ')')
                                                                  metasymbols
         G.addEdge(i, i+1);
   return G;
}
```

#### NFA construction: analysis

Proposition. Building the NFA corresponding to an M-character RE takes time and space proportional to M.

Pf. For each of the M characters in the RE, we add at most three  $\epsilon$ -transitions and execute at most two stack operations.

# Algorithms

ROBERT SEDGEWICK | KEVIN WAYNE

http://algs4.cs.princeton.edu

#### 5.4 REGULAR EXPRESSIONS

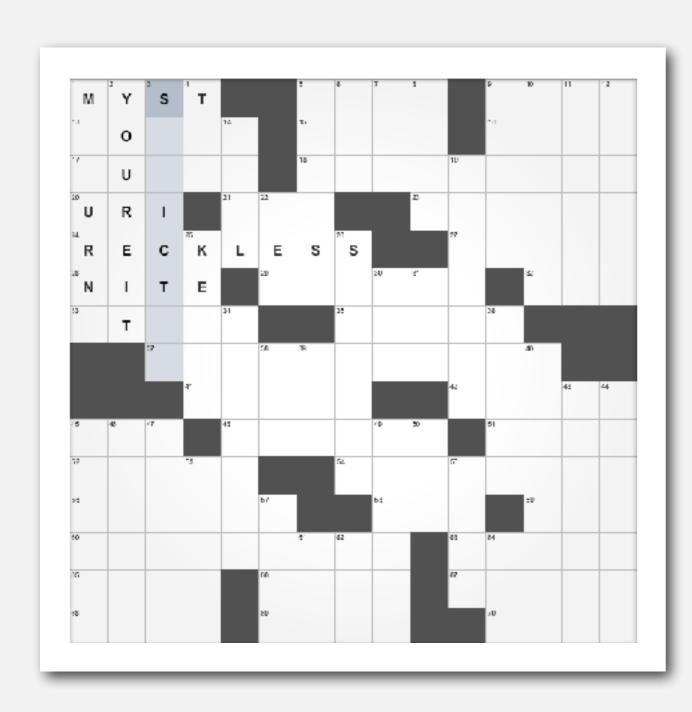

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
- applications

#### Generalized regular expression print

Grep. Take a RE as a command-line argument and print the lines from standard input having some substring that is matched by the RE.

Bottom line. Worst-case for grep (proportional to MN) is the same as for brute-force substring search.

#### Typical grep application: crossword puzzles

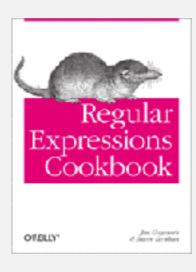

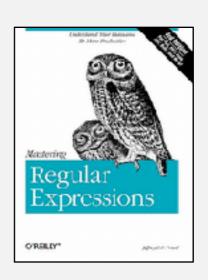

```
% more words.txt
a
aback
abacus
abacus
abalone
abandon
...
% grep "s..ict.." words.txt
constrictor
stricter
stricture
```

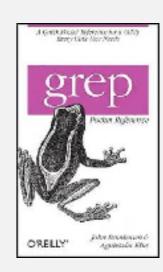

#### Industrial-strength grep implementation

#### To complete the implementation:

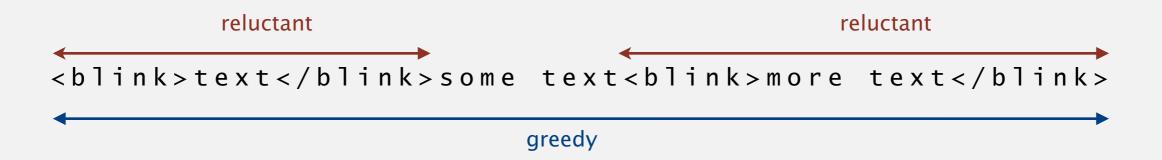

- Add multiway or.
- Handle metacharacters.
- Support character classes.
- Add capturing capabilities.
- Extend the closure operator.
- Error checking and recovery.
- Greedy vs. reluctant matching.

Ex. Which substring(s) should be matched by the RE <bli>k>.\*</blink>?

#### Regular expressions in the wild

#### Broadly applicable programmer's tool.

- Originated in Unix in the 1970s.
- Built in to many tools: grep, egrep, emacs, ....

• Built in to many languages: awk, Perl, PHP, Python, JavaScript, ....

#### Regular expressions in Java

Validity checking. Does the input match the re?

Java string library. Use input.matches(re) for basic RE matching.

```
public class Validate
{
    public static void main(String[] args)
    {
        String regexp = args[0];
        String input = args[1];
        StdOut.println(input.matches(re));
    }
}
```

#### Harvesting information

Goal. Print all substrings of input that match a RE.

```
% java Harvester "gcg(cgg|agg)*ctg" chromosomeX.txt
gcgcgggcggcggcggcggcgg
gcgctg
gcgctg
gcgctg
gcgcggcggcggaggcggaggcggctg

harvest patterns from DNA
gcgcgggcggaggcggaggcggctg

harvest links from website

http://www.princeton.edu

http://www.princeton.edu

http://www.google.com

http://www.cs.princeton.edu/news
```

#### Harvesting information

RE pattern matching is implemented in Java's java.util.regexp.Pattern and java.util.regexp.Matcher classes.

```
import java.util.regex.Pattern;
import java.util.regex.Matcher;
                                                                     compile() creates a
public class Harvester
                                                                     Pattern (NFA) from RE
   public static void main(String[] args)
   {
                                                                     matcher() creates a
      String regexp = args[0];
                                                                     Matcher (NFA simulator)
                 = new In(args[1]);
      In in
                                                                     from NFA and text
      String input = in.readAll();
      Pattern pattern = Pattern.compile(regexp);
      Matcher matcher = pattern.matcher(input);
                                                                     find() looks for
      while (matcher.find())
                                                                     the next match
         StdOut.println(matcher.group());
                                                                     group() returns
                                                                     the substring most
                                                                     recently found by find()
```

#### Algorithmic complexity attacks

#### Warning. Typical implementations do not guarantee performance!

#### SpamAssassin regular expression.

```
% java RE "[a-z]+@[a-z]+([a-z\.]+\.)+[a-z]+" spammer@x......
```

- Takes exponential time on pathological email addresses.
- Attacker can use such addresses to DOS a mail server.

#### Not-so-regular expressions

#### Back-references.

- \1 notation matches subexpression that was matched earlier.
- Supported by typical RE implementations.

#### Some non-regular languages.

- Strings of the form ww for some string w: beriberi.
- Unary strings with a composite number of 1s: 111111.
- Bitstrings with an equal number of 0s and 1s: 01110100.
- Watson-Crick complemented palindromes: atttcggaaat.

Remark. Pattern matching with back-references is intractable.

#### Context

#### Abstract machines, languages, and nondeterminism.

- Basis of the theory of computation.
- Intensively studied since the 1930s.
- Basis of programming languages.

Compiler. A program that translates a program to machine code.

- KMP string  $\Rightarrow$  DFA.
- grep  $RE \Rightarrow NFA$ .
- javac Java language ⇒ Java byte code.

	KMP	grep	Java
pattern	string	RE	program
parser	unnecessary	check if legal	check if legal
compiler output	DFA	NFA	byte code
simulator	DFA simulator	NFA simulator	JVM

#### Summary of pattern-matching algorithms

#### Programmer.

- Implement substring search via DFA simulation.
- Implement RE pattern matching via NFA simulation.

#### Theoretician.

- RE is a compact description of a set of strings.
- NFA is an abstract machine equivalent in power to RE.
- DFAs, NFAs, and REs have limitations.

You. Practical application of core computer science principles.

#### Example of essential paradigm in computer science.

- Build intermediate abstractions.
- Pick the right ones!
- Solve important practical problems.
